

# **Transport in molecular structures: an overview of present understanding**

Massimiliano Di Ventra  
*Department of Physics, UCSD*

I will present an overview of recent work on the transport properties of nanoscale structures. In particular, I will discuss effects like electromigration, local heating, inelastic current and current fluctuations, and focus on their description at the atomic level. Particular attention will be given to open questions regarding these effects, and their impact on nanoscale electronics.
